SPEEDING CAN BE A CAUSE OF SEVERE CRASH

- Drivers get lesser time to avoid mishap and the stopping distance lengthens which increases both the likelihood of crashing and the severity of the crashes.
- The Vehicle structure is rendered incapable of withstanding the force of the crash which results in serious injury to the occupants.
- The protection capability of restraint systems such as airbags and safety belts and roadside hardware and safety features such as barriers and bridge rails become nullified.
- Vehicles become prone to increased tire tread wear, rise in tire weakening operation temperature, longer stopping distances and increased brake wear.
- At faster speeds the driver's ability to accurately see and judge the distances get compromised.

Drive within the prescribed speed limits.

It is a fact that most of the accidents are caused by rash and over speeding motorists than by any other road users.

Documented research on the effects of speed has led to the specification of speed limits and formulation of strict laws against overspeeding.

Hence, stick to the prescribed speed limit. (HTV - 40 Km/hr; LMV - 50 Km/hr) Otherwise, the motorist stand a chance of

- Collision resulting in grievous injury to himself and the other vehicle involved.
- Penalty
